

# PREGNANCY AND COVID-19 IN ONTARIO

## Surveillance Update for March 2020 to March 2022

---

Over the course of the COVID-19 pandemic, BORN Ontario has been monitoring cases in pregnant individuals as part of our registry focus to facilitate and improve care. We have contributed Ontario data to a national project and learned that pregnant individuals have higher rates of hospitalization and intensive care unit (ICU) admission compared to non-pregnant individuals within the same age range. This is consistent with the experience of other countries. We have also learned that the babies of those pregnant with SARS-CoV-2 virus are more often born preterm compared to the general population of pregnant individuals ([See publication](#))<sup>1</sup>. In this report we present a summary of Ontario data for the past 2 years.

BORN's COVID-19 data comes from Case Report Forms (CRF) from participating hospitals and midwifery practice groups across Ontario and includes those individuals who had a positive PCR or Rapid Antigen Test (RAT). We also receive information from Public Health Ontario's Case and Contact Management (CCM) system for all biological females aged 15-45 who have had a positive PCR test during pregnancy. These two data sources are then linked to the BORN Information System (BIS) which provides more in-depth information about the pregnancy and birth.

We present this report to support care providers, hospitals, midwifery practice groups, families and policy makers in learning how COVID-19 in pregnancy has affected the pregnant population. Aggregate data and findings have been shared with other researchers (e.g. CANCOVID-Preg), the Ontario Ministry of Health, and care provider groups so that pregnant individuals and care providers can have up-to-date information for decision-making. Within BORN we have also looked at the [impact of the first wave of the pandemic on system wide outcomes](#)<sup>2</sup> and also have a group working specifically on the [impacts of vaccination in the pregnant population](#)<sup>3</sup>.

### Important Considerations

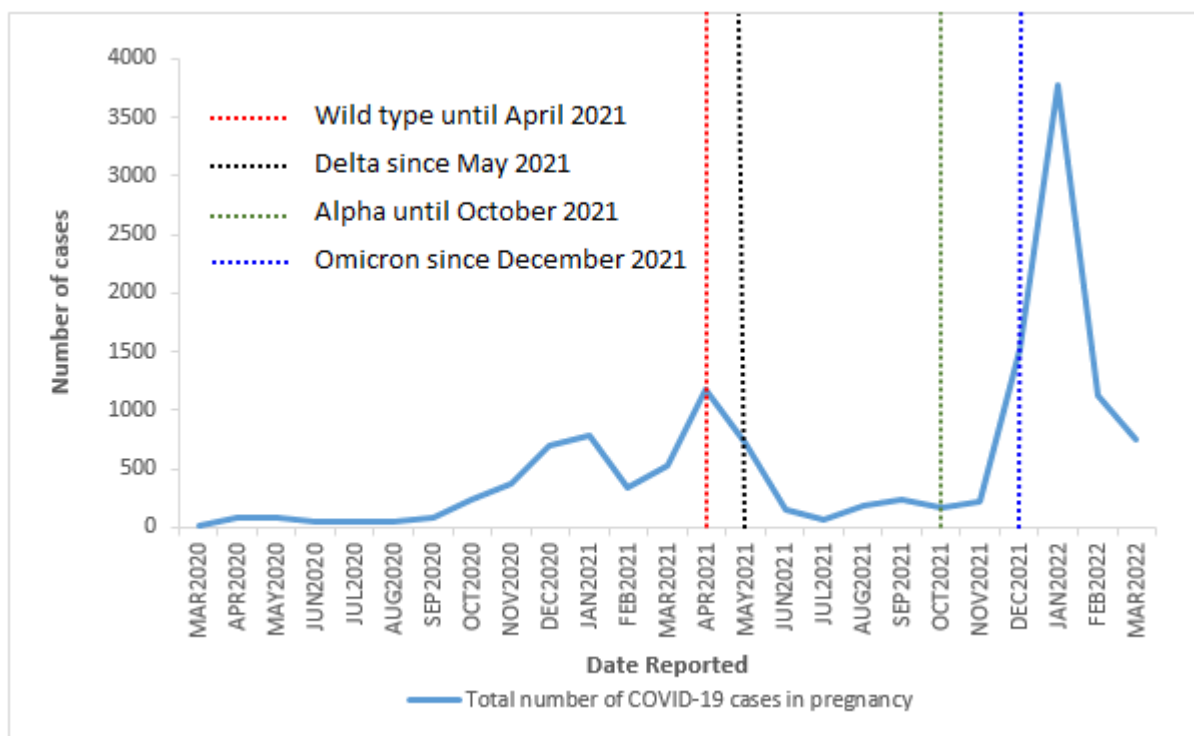

- This report only includes outcomes for confirmed cases (i.e. positive test for SARS-CoV-2 primarily on PCR, and as of January 2022 also through RAT) during pregnancy that have given birth, and that were ascertained through a CRF and/or CCM record between March 2020 and March 2022. Testing in Ontario (especially through PCR) has decreased in 2022. Only CRFs include cases ascertained through RAT, so the total number of cases is likely underestimated.
- If a CRF and CCM record was received for the same individual, it counted as a single case. The two data sources complement each other to provide more thorough information for the case.
- This report is not a complete ascertainment of cases since March 1st, 2020. This report underestimates the number of cases as some submissions are delayed and therefore not included here. Moreover, pregnant individuals were not eligible for PCR testing during a two-week period in December 2021, so any cases during that time are not included.

## COVID-19 in pregnancy: Overall trends

From March 1, 2020 – March 31, 2022 there have been 13,511 pregnant individuals in Ontario who have tested positive for SARS-CoV-2 during pregnancy. As shown in figure 1a and figure 1b, the outbreak waves seen in the general population mirror those seen in pregnant individuals for both overall and severe COVID cases. SARS-CoV-2 wild type was present between March 2020 and April 2021. The Delta variant was identified in May 2021. The Alpha variant was present until October 2021. The Omicron variant was identified in December 2021. There may have been an overlap of variants at different time periods (figure 1a and figure 1b). The majority of cases have been diagnosed during the first and second trimesters of pregnancy (table 1).

**Figure 1a - Number of pregnancies affected by COVID-19 in Ontario**

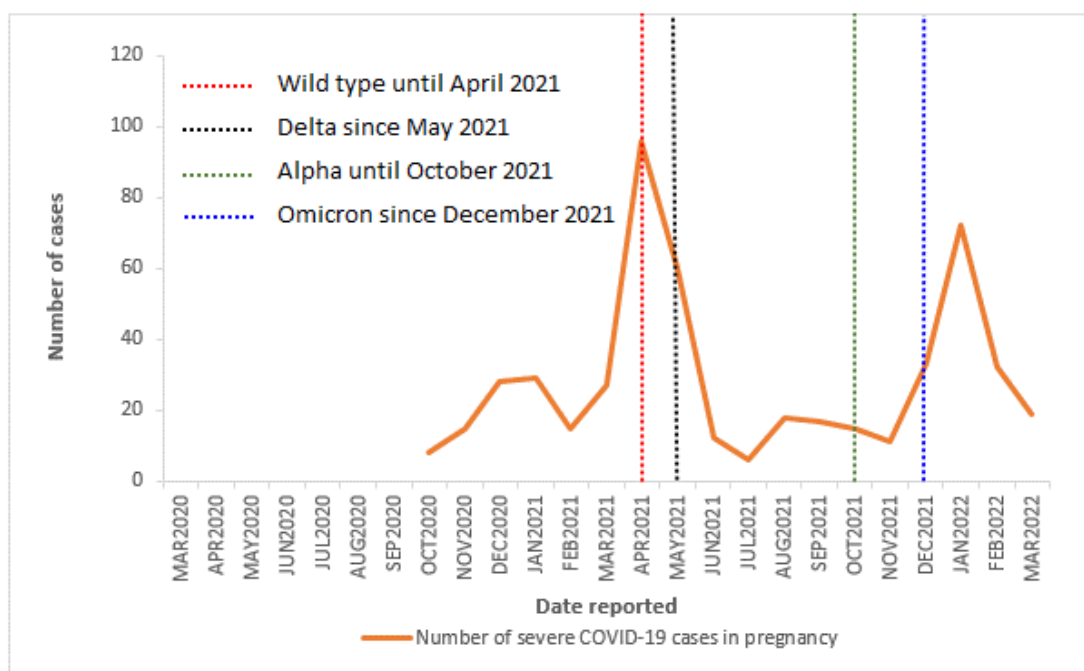

**Note:** Time periods for variants of concern in Ontario were retrieved from Science Table COVID-19 Advisory for Ontario: [Ontario Dashboard](https://covid19-sciencetable.ca/ontario-dashboard/) <sup>4</sup>

\*\* There were 104 additional COVID-19 cases in pregnancy but the date of infection was not reported. These cases have been excluded from the line graph

4. Science Table COVID-19 Advisory for Ontario: Ontario Dashboard available at <https://covid19-sciencetable.ca/ontario-dashboard/?msclkid=96c174f8d07611ecbd1a002f317661d6> Accessed May 30, 2022

**Figure 1b - Number of severe\* COVID-19 cases in pregnancy in Ontario**

**Note:** Time periods for variants of concern in Ontario were retrieved from Science Table COVID-19 Advisory for Ontario: [Ontario Dashboard](https://covid19-sciencetable.ca/ontario-dashboard/) <sup>4</sup>

\* Severe COVID-19 cases include anyone with any of the following: hospitalization, ICU admission, death, pneumonia, sepsis, respiratory failure, acute respiratory distress syndrome, heart failure, septic shock, coagulopathy, disseminated intravascular coagulopathy, renal failure, liver dysfunction, or ventilatory support

\*\* There were 12 additional severe cases in pregnancy but the date of infection was not reported. These cases have been excluded from the line graph

\*\*\* Cannot report number of severe cases between March and September 2020 due to small cell count

**Table 1 - Gestational age at time of confirmed COVID-19 - March 1, 2020 to March 31, 2022**

Gestational age at diagnosis	Frequency (n=13,511) <sup>1</sup>	Percent
Less than 14 weeks	3202	23.7
14-27 weeks	4701	34.8
28-37 weeks	3863	28.6
38-42 weeks	1537	11.4
Missing	208	1.5

<sup>1</sup> Total number of individuals with COVID-19 during pregnancy

4. Science Table COVID-19 Advisory for Ontario: Ontario Dashboard available at <https://covid19-sciencetable.ca/ontario-dashboard/?msckid=96c174f8d07611ecbd1a002f317661d6> Accessed May 30, 2022

## COVID-19 in pregnancy: Disease severity

From March 1, 2020 to March 31, 2022, 96% of pregnant individuals with COVID-19 experienced mild to moderate disease and 4% experienced severe disease (table 2). A larger proportion of pregnant individuals with severe COVID-19 had co-morbidities compared to those with mild to moderate disease, as well as the general pregnant population during the same time period (table 2).

Of the 13,511 pregnancies with COVID-19, 505 (3.7%) pregnant individuals were hospitalized due to COVID-19 with the majority (421) having a general admission and 84 being admitted to the ICU. A total of <6 individuals died (table 3). These proportions are higher than those of the general female population in Ontario aged 20-39 who were hospitalized due to COVID-19 illness or complications (hospitalization = 0.1%)<sup>5</sup>. Overall, respiratory complications were the most prevalent SARS-CoV-2 complications with pneumonia being the most common (table 4). Length of hospital stay, in days, due to COVID-19 illness and/or complications varied considerably (mean= 5.7, median=2, std=12.4) (table 5). Three-quarters of hospitalized patients were admitted to hospital for 6 days or less (data not shown), and a small number of pregnant individuals were admitted to hospital for 30 days or more due to COVID-19. There was far less variability for pregnant individuals who were admitted to hospital for birth during the same time period; they were primarily admitted to hospital for just over one day (mean=1.4, median=1.3, std=0.7).

**Table 2 - Frequency of maternal comorbidities according to COVID-19 severity - March 1, 2020 to March 31, 2022**

	General Pregnant Population	Mild and Moderate COVID-19	Severe COVID-19	Total for COVID-19
Maternal Comorbidities	Frequency and percent (n=281,539)	Frequency and percent (n=12,966)	Frequency and percent (n=545)	Frequency and percent (n=13,511)
Diabetes	29,220 (10.4%)	979 (7.6%)	67(12.3%)	1046 (7.7%)
Hypertension	19,767 (7.0%)	582 (4.5%)	45(8.3%)	627 (4.6%)

\* Includes pre-existing diabetes and hypertension, as well as diabetes and hypertension during pregnancy

\*\* Less than 1% of individuals overall had pre-existing cardiovascular disease or asthma, thus stratification by COVID-19 disease severity was not possible due to small cell counts

**Table 3 - Maternal outcomes for all pregnancies with COVID-19 - March 1, 2020 to March 31, 2022**

	Frequency (n=13,511) <sup>1</sup>	Percent
No hospitalization	13,006	96.2
Hospitalization <sup>2</sup>	505	3.7
General admission	421	3.1
ICU admission	84	0.6
Death <sup>3</sup>	<6	---

<sup>1</sup> Total number of individuals with a COVID-19 during pregnancy

<sup>2</sup> Hospitalizations due to COVID-19

<sup>3</sup> Cannot report exact number of deaths due to small cell count

**Table 4 - Maternal SARS-CoV-2 complications and use of ventilator support due to COVID-19 - March 1, 2020 to March 31, 2022**

	Frequency (n= 13,511) <sup>1</sup>	Percent
<b>Pneumonia</b>	93	0.7
<b>Sepsis</b>	7	0.05
<b>Respiratory failure</b>	16	0.1
<b>Acute respiratory distress syndrome</b>	24	0.2
<b>Liver dysfunction</b>	6	0.04
<b>Other complications<sup>2</sup></b>	19	0.1
<b>Ventilatory support<sup>3</sup></b>	39	0.3
<b>Severe COVID-19 during pregnancy<sup>4</sup></b>	545	4.0

<sup>1</sup>Total number of pregnant individuals with COVID-19 during pregnancy, regardless of disease severity

<sup>2</sup> Some complications have been grouped together due to small cell counts. Other complications include heart failure, renal failure, septic shock, coagulopathy, and disseminated intravascular coagulopathy

<sup>3</sup> Ventilatory support has been grouped together due to small cell counts. It includes extracorporeal membrane oxygenation (ECMO), non-invasive ventilation and invasive ventilation.

<sup>4</sup> Includes anyone with any of the following: hospitalization, ICU admission, death, pneumonia, sepsis, respiratory failure, acute respiratory distress syndrome, heart failure, septic shock, coagulopathy, disseminated intravascular coagulopathy, renal failure, liver dysfunction, or ventilatory support. These are not mutually exclusive conditions.

**Table 5 - Length of stay (LOS) in hospital due to COVID-19 versus average postpartum length of stay in days - March 1, 2020 to March 31, 2022\***

	Mean	Median	Standard deviation	Minimum	Maximum
<b>Average postpartum LOS for all pregnancies</b>	1.4	1.3	0.7	< 1	5
<b>COVID-19</b>	6.2	2	13.2	< 1	181

\* Includes vaginal and cesarean deliveries during the same time period

### COVID-19 in pregnancy: Birth Outcomes

Of the 8912 infants born to an individual with a COVID-19 diagnosis during pregnancy where a birth has occurred as of March 31, 2022, 50 (0.6%) were stillbirths (table 6), and the majority were born vaginally (table 7). In comparison, the stillbirth rate for the 5-year period pre-pandemic in Ontario was 0.47%<sup>6</sup>. Of the livebirths, 9.1% were born premature (table 8). The typical preterm birth rate in Ontario is 7.7%, and varies by region from 5.6% - 12.1%<sup>7</sup>. Moreover, 7.1% of infants born to mothers with COVID-19 at during pregnancy had a birth weight of less than 2500 grams (table 9) and 1241 (14%) were admitted to the neonatal intensive care unit (NICU).

Due to limited SARS-CoV-2 testing performed on newborn infants at birth in Ontario, this outcome is not reported here. However, [a study conducted in Ontario](#)<sup>8</sup> reported that vertical transmission (from pregnant individual to infant) is unlikely.

**Table 6 - Outcome of pregnancy for COVID-19 pregnancies - March 1, 2020 to March 31, 2022**

	Frequency (n=8912) <sup>1</sup>	Percent
Live birth	8862	99.4
Stillbirth at $\geq 20$ wks or $\geq 500$ gms <sup>2</sup>	50	0.6

**Note:** 4734 pregnancies are still ongoing or a birth record is not yet available

<sup>1</sup> Total number of infants delivered (including live births and stillbirths)

<sup>2</sup> Spontaneous stillbirth which may have occurred during the antepartum or intrapartum period

**Table 7 - Mode of delivery for pregnancies with COVID-19 - March 1, 2020 to March 31, 2022**

	Frequency (n=8912) <sup>1</sup>	Percent
Spontaneous vaginal	5282	59.3
Assisted vaginal	633	7.1
Induced or spontaneous labour cesarean section	1411	15.8
No labour - cesarean section	1575	17.7
Mode of delivery missing	11	0.1

<sup>1</sup> Total number of infants delivered (including live births and stillbirths)

**Table 8 - Gestational age at birth for liveborn infants to pregnant individuals with COVID-19 - March 1, 2020 to March 31, 2022**

	Frequency (n=8862)	Percent
< 28 weeks	54	0.6
28 - 31 weeks	65	0.7
32-33 weeks	102	1.2
34-36 weeks	581	6.6
$\geq 37$ weeks (term)	8060	90.9

**Table 9 - Birth weight of liveborn infants to pregnant individuals with COVID-19 - March 1, 2020 to March 31, 2022**

	Frequency (n=8862)	Percent
< 2500g	634	7.1
2500 - 3999g	7311	82.5
$\geq 4000$ g	732	8.3
Missing	185	2.1

### COVID-19 in pregnancy: Vaccination in pregnancy

Vaccination became widely available for pregnant people in April 2021. Of the 368 pregnant individuals who were hospitalized for COVID-19 from April 1, 2021 – March 31, 2022, approximately 75% of hospitalizations and 93% of ICU admissions were in unvaccinated individuals (table 10).

**Table 10 - Maternal outcomes by vaccination status at time of COVID-19 for pregnant individuals hospitalized between April 1, 2021 and March 31, 2022<sup>1</sup>**

	Unvaccinated	Partially vaccinated <sup>2</sup>	Fully vaccinated	Boosted	Total
<b>Hospitalization</b>	275 (74.7%)	13 (3.5%)	65 (17.7%)	15 (4.1%)	368 <sup>3</sup>
<b>ICU admission<sup>4</sup></b>	57 (93.4%)	< 6	< 6	< 6	61
<b>Death<sup>4</sup></b>	<6	0	0	0	<6

<sup>1</sup> Vaccination became widely available for pregnant individuals in Ontario in April, 2021. Total sample includes hospitalized pregnant individuals who had a COVID-19 between April 1, 2021 and March 31, 2022 only. Hospitalizations and deaths prior to this time period are not included in the table

<sup>2</sup> Individuals who received their first dose at least 14 days prior to the COVID-19 and who have not yet received their second dose in the past 14 days

<sup>3</sup> Total includes both general admissions and ICU admissions

<sup>4</sup> Cannot report exact number of ICU admissions or deaths in some subgroups due to small cell count

**BORN would like to thank the hospital and midwifery practice groups for contributing to this important COVID-19 in pregnancy surveillance**

### Accessibility Links – Long descriptions

**Figure 1a** is a line graph with the y-axis representing the number of cases of COVID-19 in pregnancy and the x-axis representing the date of infection in months. Four vertical lines representing the different SARS-CoV-2 variant waves in Ontario cross the line graph at different months. SARS-CoV-2 wild type was present between March 2020 and April 2021. The Delta variant was identified in May 2021. The Alpha variant was present until October 2021. The Omicron variant was identified in December 2021. There may be an overlap of variants at different time periods.
